Implemented in 4.3

Official Documentation Available  
This topic is now covered in [Groovy module](#).

Following some ideas

- store scripts similar to the templates in the templates workspace
  - or extra workspace, or resources?
- special property to execute on startup
  - can be used for repairing
- add support for groovy template/paragraph models
  - make properties accessible in freemarker: `model.prop`
  - one can select the script in the in-place template's dialog?
- add support for bean notation for content
  - similar to their xml support
  - `content.child.@property`
- add handy closure support
  - `content.visit(){..}`
- add builder support
- add scripted commands
  - make sure that they can be used easily in the observation, schedule and workflow module
  - use case example: archive news & events
- add the groovy servlet to support scripted servlets
- add support for data module importers
  - combine the nice xml support with the builder!
