

Model Class

Groovy Model Classes can be created with this base. Just be sure to create a matching package structure.

```
package info.magnolia.groovy.component.models;

import javax.jcr.Node;

import info.magnolia.rendering.model.RenderingModel;
import info.magnolia.rendering.model.RenderingModelImpl;
import info.magnolia.rendering.template.configured.ConfiguredTemplateDefinition;

public class MyGroovyModel extends RenderingModelImpl {

    public MyGroovyModel(Node content, ConfiguredTemplateDefinition definition, RenderingModel<?> parent) {
        super(content, definition, parent);
    }

    public String execute() {
        return null;
    }
}
```
