

Siteimprove module

Download	magnolia-siteimprove.jar
Connector Pack	Optimization Connector Pack
License	MLA
Issues	SIMPROVE
Maven site	Siteimprove
Latest version	1.1.5

The Siteimprove connector enables you to perform SEO checks by using the cloud-based application [Siteimprove](#). It is a tool to help you score higher ranking in search engines and check how your content is performing over all.

Module structure

artifactID	Description
magnolia-siteimprove	Provides a default implementation to connect to Siteimprove .

Installing

Maven is the easiest way to install the modules. Add the following dependencies to your [webapp](#). All the other necessary dependencies will be brought in automatically:

```
<dependency>
  <groupId>info.magnolia.seo</groupId>
  <artifactId>magnolia-siteimprove</artifactId>
  <version>1.1.5</version>
</dependency>
```

Pre-built JARs are also available for download. See [Installing a module](#) for help.

- [magnolia-siteimprove.jar](#)

Note that this connector also requires the following library for module license checks:

- [magnolia-services-licence.jar](#)

Configuration

The module provides two configuration options.

mapperClass	optional , defaults to <code>info.magnolia.connector.siteimprove.mapper.DefaultMapper</code> The default mapping implementation relies on the related site definition domain. You can add your custom implementation of the page mapping by implementing <code>info.magnolia.connector.siteimprove.mapper.SiteImproveMapper</code> and changing the related configuration.
token	required Token provided by Siteimprove. The first time Siteimprove is contacted the token is stored here. There is no need to set the token manually.

Usage

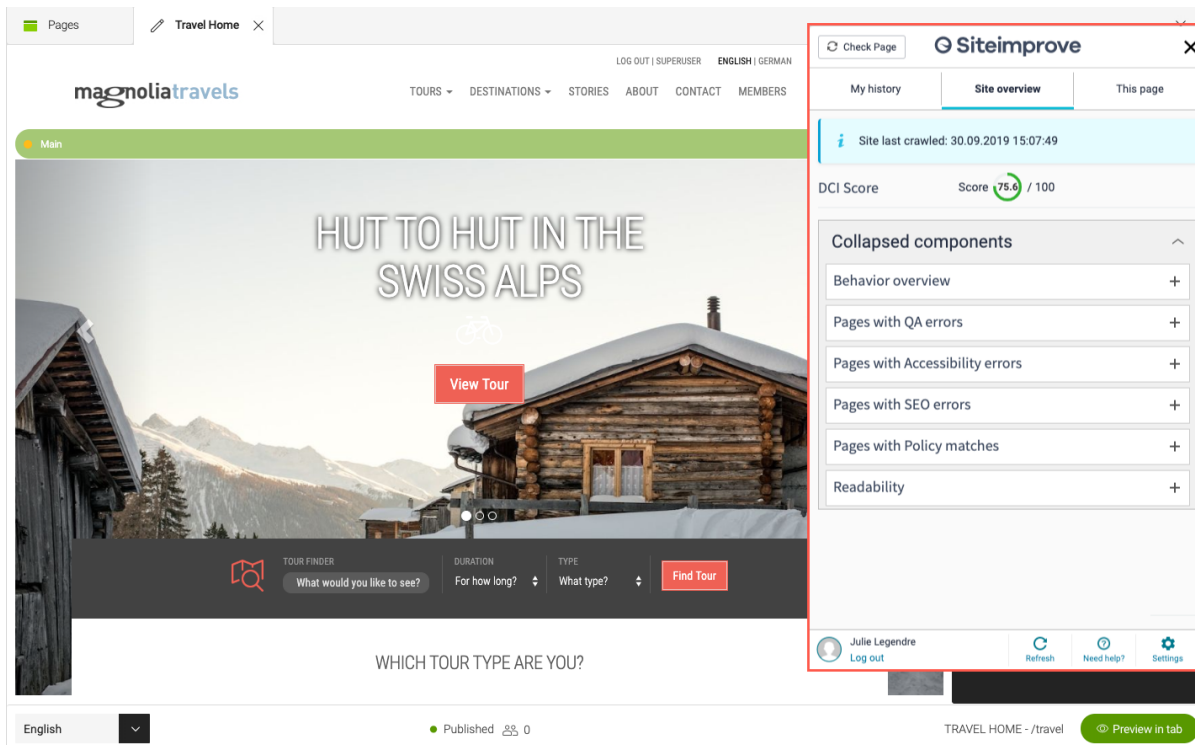

Using the Siteimprove connector helps you fix and improve website accessibility, SEO, content quality and more. Siteimprove crawls websites through public URLs, which means that all pages are indexed from their public addresses.

Accessing the Siteimprove dashboard

To access the Siteimprove dashboard for the first time:

1. Log into Magnolia.
2. Open a page in the Pages app.
3. Click the Siteimprove icon  to the right of the page.
4. In the pop up window that opens, enter your Siteimprove credentials.

The Siteimprove dashboard then displays the SEO results for the page you have open (and site the page belongs to).

The screenshot shows the Magnolia website interface with a Siteimprove dashboard overlay. The website header includes the Magnolia Travels logo and navigation links. The main content area features a large image of a Swiss Alps hut with the text "HUT TO HUT IN THE SWISS ALPS" and a "View Tour" button. Below this is a "TOUR FINDER" section with search filters and a "Find Tour" button. The Siteimprove dashboard overlay is positioned on the right side of the page, displaying the following information:

- Check Page** button and **Siteimprove** logo.
- Navigation tabs: **My history**, **Site overview** (selected), **This page**.
- Site last crawled: 30.09.2019 15:07:49.
- DCI Score: Score **75.6** / 100.
- Collapsed components** section with expandable items:
 - Behavior overview (+)
 - Pages with QA errors (+)
 - Pages with Accessibility errors (+)
 - Pages with SEO errors (+)
 - Pages with Policy matches (+)
 - Readability (+)
- User profile: **Julie Legendre**, **Log out** button.
- Utility buttons: **Refresh**, **Need help?**, **Settings**.

At the bottom of the page, there is a language selector set to "English", a "Published" status indicator, and a "Preview in tab" button.

Once you have logged in for the first time, the Siteimprove dashboard remains available via the icon for each page you open.

If the Siteimprove icon is greyed out, log out of Magnolia and back in again.

Setting your website to be observed

Before any SEO check can be performed, you must set your website to be observed by Siteimprove. You can do this in the [Siteimprove application](#) itself.

My site and group access

All sites and groups that can be accessed through your user profile.

Performing an SEO check

To perform an SEO check on your site, tree or page, click **Check page** in the Siteimprove dashboard. Siteimprove analyzes the page's content and displays results such as the DCI page score, number of broken links, misspellings and more.

Note: The default spell checker integration we provide is to an external service [TextGears](#), Siteimprove offers its own.

Release history

Siteimprove module 1.1.5

[SIMPROVE-3](#) - Getting issue details... [STATUS](#)

Siteimprove module 1.1.4

The [Siteimprove module](#) is now part of the Optimization Connector Pack. Siteimprove enables you to perform SEO checks using the cloud-based application [Siteimprove](#). It is a tool to help you score higher ranking in search engines and check how your content is performing over all.

For documentation for these legacy versions of Siteimprove, see [Incubator - Siteimprove](#).

Version 1.1

Updated for Magnolia 6.0 compatibility.

Version 1.0.4

[SIMPROVE-1](#) - Getting issue details... [STATUS](#)

Version 1.0.3

Initial release of the Extensions version of the module.

Siteimprove module compatibility
