## Main Discussion

- Situation:
  - None of pages or stories app create a real blog post, they both create pages
    - URLs may need tweaking for blog entries
    - Overview pages needed for blogpost
    - Part of a regular tree structure, need a timeline
    - Blog posts usually don't change (are not updated)
  - Everybody is building their own blog solutions
  - Original Magnolia's blog module doesn't exist anymore
  - Blog should be CORE, it's just content management
- Ideal case: no folder structure for blogs, filters on times, tags, authors, etc.
- Magnolia should provide all flexibility to build blogs:
  - Difficult to cover all use cases out of the box
  - But adding some Java to the blog content app for filtering & storing
- Goal to release a npm / light module for blogs soon
  - demo of Michal
    - Front-end using vue.js & FTL
    - Author: dedicated app & stories app for individual entries
  - should be a base for the community to build the specific use cases on it
- Commenting would be relevant too
  - usually a third party integration nowadays (e.g. Disqus)

## Side Discussion

- Stories app is lacking i18n
  - part of the roadmap
