

Concept - Account lockout

✂

Your Rating: ☆☆☆☆☆ Results: ★★★★★ 113 rates

Implemented in 4.4

Official Documentation Available

This topic is now covered in [Automatic lockout](#).

Goal

- [MAGNOLIA-3557](#)
- Make account unaccessible after number of failed login attempts
- Let admin set number of max attempts (default 5?)

Solutions

a) Modify User interface and JCRAuthenticationModule

- after each failed attempt increase int number
- save this value as node data
- if reaches max value then lock
- after success login null value

b) Implement in login filter

- check user from http request and login result status

- check for user "repetition"

Actual lockout

Hard lock - use existing method to disable account until is enabled again by admin.

Time lock - implement lock based on time period before account is enabled again with possibility to null this and make account accessible immediately (in edit user dialog probably)
