

Concept - Config By X

This is the entry point for the whole Config By X theme.

What does it mean

Config By X means that configuration for magnolia can be provided by different means - no longer only by jcr as today. Independently from how it's actually provided these configurations will end up in memory.

The Pieces

Config By X basically consists of the model (interfaces + definition classes) as well as the various mechanisms to populate the module (from JCR via Node2Bean, by Code via builders or by file via a new mechanism).
