

Clustering

+

Your Rating: ☆☆☆☆☆ Results: ★★☆☆☆ 83 rates

Notes from Unconference 2012

- cluster that will include author is more difficult to achieve than public only (firewall issues)
- clustering configuration is at the moment too complicated and undocumented for people to be really confident to set it up and experiment with it.
- it would be great to provide script to turn on/off clustering of any workspace (possibly via export import of content and without versions)

Notes from 18.10.2012 meeting

- problematic areas
 - scheduling
 - workflow
 - notifications: system wide notification
 - soft locking
- solutions
 - master instance
 - how to define it
 - one is elected (revolution)
 - only for backend --> no authors
 - could this be a pattern for [UGC](#)
 - distribute some tasks? to share calculations
 - clustered memory solutions
 - messages broker
