

Imaging Module improvements for DAM and external assets

 [MGNLSTK-1438](#) - ImagingSupport should be decoupled from JCR CLOSED

Here are a couple of things we could do with the imaging module to help DAM integration:

- **To use imaging for previews/thumbnails:** provide an alternative to the `ImagingServlet` entry point - either directly as a `VaadinComponent`, or has a component that stores generated images in temporary files. (as an alternative, it could also generate [data URIs](#))
- **To resize/filter images available in a DAM Provider:** provide a `ParameterProvider` which knows the DAM API and it's composite keys
- **To generate links to resized images:** refactor the `ParameterProvider` / `ParameterProviderFactory` API so that it can also generate links, not just decode them ?
