

# Concept - Personalization - AggregationState vs. @Injected + @LocalScoped new object (TraitCollector)

## Intro

For the personalization feature we have to store traits of visitors somewhere "accessible" in a unified manner.

Initially, the AggregationState was selected, but suggestions were made, to use a different approach, especially considering that the module will be EE only.

## AggregationState (AS)

- + Could be used for Channel/Device
- AS is already packed
- Some code would have to go in core?

## TraitCollector

- + Injectable anywhere
- + Installed in p13n module
- Less explicit
- ? Lifecycle

## Decision

It was decided to use a @LocalScoped TraitCollector
