Assuming Magnolia 4.2 and WebDAV module 1.0-alpha-1 are used:

Client OS	User-Agent *	Client Editor software	Status	Identified issues/comments
OS X 10.5.8	WebDAVFS /1.8 (01808000) Darwin/9. 8.0 (i386)	vi		
OS X 10.5.8	WebDAVFS /1.8 (01808000) Darwin/9. 8.0 (i386)	TextWrangler	✅	
OS X 10.5.8	WebDAVFS /1.8 (01808000) Darwin/9. 8.0 (i386)	Dashcode	❌	DashCode is mapped to css files in Finder by default; unfortunately, saving isn't possible at the moment, as DashCode tries to create temporary files and other artifacts on the filesystem (which happens to be the mounted WebDAV directory in this case), which aren't supported by the current module. Letting those be created would create "noise" in the workspace, and ignoring them (i.e not creating them but silently accepting those requests anyway) might have side effects too.
OS X 10.5.8	Cadaver	—	✅	Most operations simply work under Cadaver.
Windows XP	WebDrive	NotePad++, notepad, etc..	✅	
Windows XP	Microsoft-WebDAV-MiniRedir/5. 1.2600	—	❌	Needs to run on port 80. `net use x: "http://10.0.0.109/magnoliaAuthor/.webdav/resources/" /User: superuser`. Observed behaviour: the server a 401 error, which is to be expected; this happens before the `net` command shows the prompt for the user's password, and no further request seem to be emitted after the password is entered.
Windows Vista (up to date)	"map network drive"		✅	guide is attached
Windows Vista	cmd line		❌	f.e. `net use x: "http://127.0.0.1/magnoliaAuthor/.webdav/resources" /User:superuser superuser` (port 80) - is mapped on x drive as `resources (\\127.0.0.1\DavWWWRoot\magnoliaAuthor\.webdav)` - so you can see the x drive but it's not accessible Currently can't map MGNLWEBDAV-20@jira
Windows Vista	WebDrive		✅	shareware

Windows Vista	Total commander plug-in		✅	
Windows Vista	AnyClient		✅	freeware
Windows Vista	DataFreeway		✅	freeware
Windows Vista	Gladinet		✅	Starter Edition is free. Saved edits inconsistently uploaded to workspace.
Windows Vista	Bit Kinex		✅	
Windows Vista	CrossFTP Pro		❌	Was not able to connect with Magnolia on localhost.
Windows Vista	Red Drive		❌	freeware. Would not install.
Ubuntu 9.10, 10.04 etc. (should work at whatever Linux distribution running kernel 2.6)	terminal		✅	f.e. `mount -t davfs http://localhost:8080/magnoliaAuthor/.webdav/resources /media/mgnl_webdav`

Want to help filling this in ? If your client of choice works, or doesn't, add the `info.magnolia.debug.DumpHeadersFilter` to your installation, enable debug-level logging for `info.magnolia.module.webdav`, and add a line to the above table !

- User-Agent: look at the request headers; this could tell us how WebDAV is accessed, if using a filesystem mapping mechanism (which?) or if the client editor is supporting WebDAV natively, etc.
