

Removing /home redirect

Magnolia's default installation in the cloud configures a virtual URI mapping in the public [space](#) of every [environment](#) to redirect from / to home. When using custom (multi)site configurations, you should change this redirection in public spaces, otherwise the site configurations will not work correctly.

The mapping to be updated is on the `/modules/magnolia-now-sample/virtualURIMapping/default` node.

By default, the AdminCentral of a public instance is not accessible due to security reasons.

To be able to access it in the Live environment and update the redirection configuration, you need to obtain access rights. You can ask for them via the [HD portal](#).

We recommend the following procedure:

1. Login to the AdminCentral of the public instance.
2. In the Configuration app, update the value of this property:
`/modules/magnolia-now-sample/virtualURIMapping/default@toURI`
